

Regular expression

cleaning

Regular Expression (Regex) is a way to describe **patterns in text** so we can search, match, extract, or replace specific parts of strings.

Simple definition

A regular expression is a special pattern used to find and manipulate text.

Why do we need regex?

Because in real data, text is messy:

[abc123@gmail.com](#)
John-25
+8801712345678
[https://example.com](#)

Regex helps us answer questions like:

- Find all emails
- Extract phone numbers
- Validate passwords
- Remove symbols
- Split sentences
- Clean text in NLP
